### What's New In Media Access Control Address Update?

- Added all ThinkCentre A50 models that the utility can detect. - Fixed an issue in which a scan of a connected device (e.g. a printer) might not detect a ThinkCentre A50 system if a process was blocking on USB port releases. In order to update the MAC address, you will need to boot to the BIOS setup utility, then find the "EEE - EEPROM - MAC Address" page. It will look something like this: Here, you will need to update the MAC address that you wish to use to a new one that is supplied by Media Access Control Address Update. Be sure to test this new MAC address for a few minutes before updating the system's EEPROM. It is recommended that you check the CBL reporting process from Windows Event Viewer for this new MAC address. Once you are sure the new MAC address has been configured correctly, make sure you disconnect the network adapter from the system, then unplug and remove the network cable. To boot the system, you will need to hold down the key combination F2 immediately after the system is started. This utility can be used for updating the MAC address of any other systems that are compatible. You can find out if the firmware on your system supports this utility on the following pages:  
Update: I have now updated the above post with a video that shows the process in action. The release of the most recent patch by SCL to the ThinkPad X20 E-Series is a good move. This provides the users with a better overall experience when using the TrackPoint and the keyboard. I tested this patch on the pre-release version and it seems to perform just as well. Microsoft has released the second patch for the MS08-067 vulnerability. The patch is available for the x64 editions of Windows Server 2008 and Windows Server 2008 R2. So far the x86 editions of these two servers are not covered by this update, though it is expected that they will be covered in a future update. You can download the patches for x64 and x86 editions of these servers by visiting the Microsoft Security Bulletins page. Microsoft has confirmed that it has fixed the vulnerability that allowed attackers to execute malicious code using ShellExecute. The vulnerability had been discovered by members of Microsoft's Security Response Center. The affected files are: shlwapi.dll shlwapi.dll.mui sh
